Early Psychosis Declaration for Asia by the Asian Network of Early Psychosis

亞洲早期思覺失調網絡發表的《亞洲早期思覺失調聲明》

Asian Network of Early Psychosis Writing Group*

* Group members listed at the end of paper

Abstract

In line with the Early Psychosis Declaration issued by the World Health Organization and the International Early Psychosis Association, as well as the International Clinical Practice Guidelines for early psychosis by the latter in 2005, increasing interest in early intervention programmes is evident throughout Asia. Experience sharing and close collaboration that take into account the unique Asian context are needed to facilitate development of early psychosis services, education, and research in the region. The Asian Network of Early Psychosis has defined a set of Asian-specific principles to guide best practice in mental health care delivery for psychotic disorders in Asia. These principles are outlined in this paper.

Key words: Asia; Culture; Early intervention; Psychotic disorders

摘要

隨著2005年世界衛生組織和國際早期思覺失調協會頒佈的《早期思覺失調聲明》，以及後者頒佈的《國際早期思覺失調臨床方針》，思覺失調早期干預在亞洲越受關注。為了促進符合亞洲人口的早期思覺失調服務的发展、教育和研究，各地的經驗交流和緊密合作是必要的。亞洲早期思覺失調網絡（Asian Network of Early Psychosis）近期制定一套針對亞洲人口的思覺失調護理準則，為這地區精神病人口的精神健康護理提供最佳指引。本文將概述這些準則。

關鍵詞：亞洲、文化、早期干預、思覺失調

Introduction

Since the introduction of the concept of ‘early intervention for psychotic disorders’ in the 1990s, many early intervention programmes for psychosis have taken root in western countries. In Asia, the early intervention programmes were first introduced in Hong Kong and Singapore in 2001. Since then, several other similar programmes have been set up across Asia. Increasing interest in early intervention programmes is now evident in the region, and experience sharing and close collaboration are called for to facilitate development of early intervention for psychosis services, education, and research in Asia.

The Asian Network of Early Psychosis (ANEP) is an informal network of clinicians and researchers working in early intervention for psychosis in Asia. Addressing the specific culture and values in the Asian setting, the ANEP provides a platform to facilitate development of early intervention services in Asia through close exchanges and experience sharing across member sites. The ANEP also aims to promote research in the course, outcomes, and early intervention service delivery of first-episode psychosis in Asia, and encourage use of standardised instruments and assessment procedures for more comparable results. To date, the ANEP has contributors from cities in China, India, Indonesia, Japan, Korea, Malaysia, Singapore, and Taiwan. Through regional meetings and symposia, collaborative research, links with other regional and international networks, as well as an online discussion forum (https://sites.google.com/site/asianearlypsychosis), the ANEP encourages groups and researchers in the region to work together for the better care of psychosis in Asia.

In line with the Early Psychosis Declaration issued by the World Health Organization and the International Early Psychosis Association, as well as the International Clinical Practice Guidelines for early psychosis by the latter institution, and taking into consideration the unique Asian context, we have defined a set of common principles with input from regional consultants of the ANEP to guide best practice in mental health care delivery in the field of psychotic disorders in the region. The principles outlined below were first discussed at the International Conference on Early Psychosis in Asia Pacific 2012, held in Hong Kong.
Mental Health Policies on Psychotic Disorders

In general, Asian countries are faced with a lack of resources in early intervention for severe mental health conditions including psychotic disorders, compared with our western counterparts. Among Asian cities where early intervention programmes have commenced, high caseloads and suboptimal management remain a problem within public mental health systems. Regional and international clinical studies\textsuperscript{3-8} have provided evidence for the cost-effectiveness of comprehensive early intervention for patients with first-episode psychosis, especially during the critical period immediately following illness onset. The extra manpower and other resource input for early intervention can be offset by reduced service utilisation in terms of hospital stay and emergency services. Close collaboration between mental health policy-makers, researchers, and clinicians is needed for more informed planning in cost-effective resource allocation and achieving the best patient outcomes and mental health care at the societal level.

Clinical Care

A set of practical clinical standards for psychosis management, including pharmacotherapy and psychosocial intervention, should be developed, taking into account Asian-specific factors in terms of physiology, psychology, cultural values, and resource limitations. In particular, we sought to:

- explore and pioneer optimal interventional approaches in the context of low mental health resources and high caseload (e.g. utilisation of the primary health service in developing clinical standards, education, and training materials);
- explore and enhance Oriental cultural, societal, and familial strengths for better care of early psychosis patients;
- encourage community care instead of institutional care for early psychosis;
- understand service delivery barriers to early psychosis detection and management;
- advocate adequate consultation time for early psychosis patients; and
- develop training systems for specialised professionals working in early psychosis.

Pharmacotherapy

Antipsychotics are the mainstay of treatment for psychotic disorders. In Asia, the patients and their family’s acceptance of medication treatment remains low and should be enhanced, and clinical experience should be accumulated on the use of antipsychotics in Asian populations. There are needs to:

- (1) reinforce correct perception of pharmacotherapy and attitudes to medication in early psychosis patients and their families; and
- (2) explore how treatment response and side-effects of medication are different among Asians in terms of ethnopsychopharmacogenetics.

Psychosocial Intervention

Non-medication interventions have crucial impacts on the outcomes of patients with psychotic disorders. Provision of psychosocial intervention services should be greatly strengthened in the region. We need to:

- provide evidence-based, culturally adapted psychosocial interventions to achieve the best possible clinical outcomes during the early critical period of the illness — these may include cognitive behavioural therapy (CBT), family therapy, and multidisciplinary team approaches;
- provide active and intensive psychosocial interventions by increasing consultation time, and using case management with community service programmes;
- develop and share clinical experience in modified CBT based on Oriental thinking, such as an emphasis on awareness and perception compared with a rational approach;
- develop and share experience in the implementation of community service programmes appropriate to various Asian contexts;
- capitalise on the unique Asian value of strong familial ties by promoting family support in psychosis management, including psycho-education for family members about early detection of warning signs, and psychological support for carers; and
- mobilise community leaders (e.g. religious, local, or community leaders working in early psychosis).

Table. Abbreviated Early Psychosis Declaration for Asia.

| 1. | To facilitate close collaboration between mental health policy-makers, researchers, and clinicians, in order to inform service planning and increase resources allocated for cost-effective early psychosis intervention |
| 2. | To develop a set of Asian-specific clinical practice standards for psychosis management via: |
| | - pharmacotherapy: to enhance acceptance of medication treatment, and to investigate pharmacological responses in Asians; and |
| | - psychosocial intervention: to strengthen the provision of evidence-based, culturally adapted psychosocial intervention services in the region |
| 3. | To understand and to raise the level of awareness in psychosis through public education tailored for Asian perspectives |
| 4. | To consolidate an Asian-specific evidence base on psychotic disorders, to promote research work and data-driven intervention in the region, and to facilitate collaborative projects in Asian populations |
extended families leaders), an important group with great influence that can be found in most Asian cultures, as partners in psychosocial intervention.

Education and Public Awareness

The level of awareness and understanding of psychosis remains relatively low in Asia, which contributes to long delays in help seeking, barriers to treatment compliance, and extra psychological burdens to patients and their families. Efforts are required to:

- develop and share educational materials such as brochures, posters, videos, and handouts, with a focus on psychosis rather than schizophrenia, and present them to the public in an easy and acceptable fashion for Asian or Oriental perspectives;
- promote early detection of psychosis to minimise hospitalisation and chronic disability; and
- understand and address public awareness and stigma associated with psychosis in Asian populations.

Research

An Asian-specific evidence base needs to be consolidated to better inform policy-making, clinical management, and education strategies. Concerted research efforts among Asian countries and sites are needed. We aim to: (1) promote research work and data-driven intervention as an integral component of early psychosis management; and (2) pursue collaborative projects in areas of high research priority, including:

- risk population studies in Asia;
- duration of untreated psychosis and help-seeking behaviour in Asian societies;
- early intervention during the critical period (e.g. optimal duration and outcomes of the intervention service);
- efficacy of community service programmes;
- intervention for cognitive functioning;
- biomarkers of disease vulnerability and psychosis phenotypes in Asians;
- antipsychotic treatment response in Asian populations; and
- the role of sociocultural factors in the treatment of and recovery from early psychosis in Asia.

Our Visions

With this Declaration, we aim to achieve:

- heightened public awareness and understanding of psychosis at a regional level; and
- consolidation of high-quality and compatible scientific data on psychotic disorders specific to Asian populations.

Conclusions

As a global direction for mental health care, developing early intervention for psychosis will continue to be a primary focus of efforts in Asian countries. Work in this area must concentrate on the 3 fronts of clinical care, education, and research. With increasing recognition of the effectiveness of early psychosis management, it is anticipated that governments and relevant authorities might contribute sufficient resources to realise the directives as outlined above. Bearing in mind the heterogeneity in many aspects, including culture, ethnicity, religion, social values, and economic development among Asian countries, joint efforts focusing on the common sets of needs, challenges, and opportunities across the region will hopefully facilitate progress in early psychosis intervention in Asia. Together, the Asia region will move towards a more preventive and cost-effective model for the management of psychotic disorders, easing the burden of the illness on patients, families, and society.
